Eternalism, The void, and time/space travel w/ Sevastiel

Think of the universe as we know it as a big old Jelly cube!

As 3d beings, we only experience our universe one slice at a time, moment by moment. We can't skip forward or back.

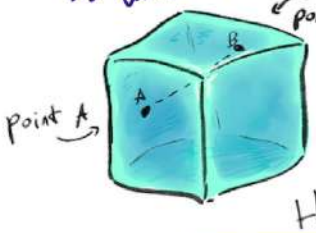

A 4D being sees the whole cube at once!

more on that later.

But what if, conceptually, we could?

Say you, in the future, wanted to get to the past.

As a 3d being, the only way we could do this would be by bringing it to us.

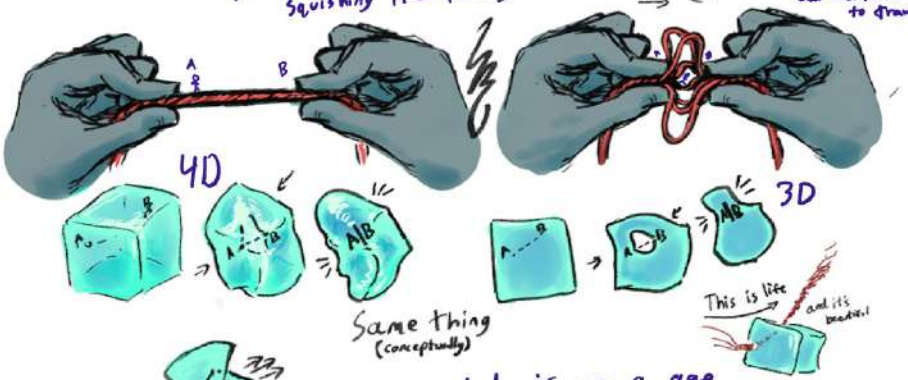

How tho?

IRL, we only can guess. Wormholes are theorized to be 4D, but aside from quantum hopping particles we dunno.

But fantasy-wise, we have The void

(The space between everything, and what we must open our world to to travel)

If we imagine persistent time as a string, Time/space travel is the equivalent of squishing it or twisting it onto itself.

Same thing (conceptually)

This is life and it's beautiful

All we must do is open a gap and step across.

(And hope we don't make the gap wrong)

P easy to mess up

But there's still the problem of 3D vs 4D.

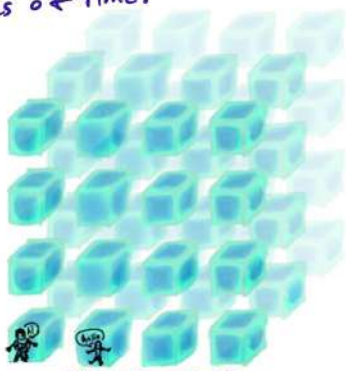

How do we reach other slices of time?

either you get lucky, or... you get help from a 4D being.

They won't have that restriction, and can be used as anchor points everywhere through time.

And maybe beyond it.

This may be a 4.5D view, unsu
